Animal genetic manipulation – a utilitarian response
Bioethics 2002 February; 16(1): 55-71

Abstract: I examine the process and outcomes of animal genetic manipulation ('transgenesis') with reference to its morally salient features. I consider several objections to transgenesis. I examine and reject the alleged intrinsic wrongness of 'deliberate genetic sequence alteration,' as I do the notion that transgenesis may lead to human genetic manipulation. I examine the alleged wrongness of killing inherent in transgenesis, and suggest that the
concept of 'replaceability' successfully justifies such killing, although not for entities deemed to possess 'personhood.' I examine 'significant suffering' associated with transgenesis and propose the radical conclusion that, although it would be wrong to prohibit animal genetic manipulation per se, utilitarians ought to support a 'default prohibition' on transgenic experiments that entail significant suffering.

Significant Hazards (1984)
Northern Lights Productions.

Abstract: A filmed debate about placing a DNA recombinant laboratory in downtown Somerville, Massachusetts, presents Harvard geneticists and microbiologists who wanted to setup a new business, and Somerville citizens and city managers who opposed it. Proponents thought there would be no danger, while opponents said that they did not know what dangers might result. The laboratory was not built in Somerville, but at Harvard.
